

Use case UC1: Join Group

Primary actor: Registered Users

Stakeholders and Interests:

Group Members: New group members want to successfully join a suitable environmental group and participate in their activities. And existing group members want reliable information about who belongs to their group member and who participates in group activities.

Team Leader: Group leader wants to have registered and eligible members join the group and maintain an accurate member list

Admin: Admin wants the system to keep accurate and valid group and members information and properly managed according to system rules.

Pre-conditions:

- The User should have a registered account
- The User should have access to group joining functionality.
- User's location matches at least one of the available neighborhoods in EAMS.
- At least one group exists in that neighborhood corresponding to user's location.
- Users should not already be a member of any Group.

Success Guarantee (post conditions):

- The user is added to selected environmental group.
- A confirmation notification is sent to the user.
- The user role in the group is recorded as "member".
- The group's member list and count are updated.
- The selected group appears in user's profile.
- Team leader gets notification that a new member has joined.
- The join Group button changes to "Joined".

Main success scenario (or basic flow):

1. The User logs into EAMS.
2. The system checks user credentials and verifies User.
3. The user views the neighborhood and groups available to them.
4. The user selects an environment group that he wants to join.
5. The system displays the selected group's information such as name, associated neighborhood, members, and activities.
6. User selects the "Join group" option.

7. The system verifies that user belongs to same neighborhood as the group.
8. The system verifies that the user is not already member of the group.
9. The system confirms again from user ("Do you want to join this group?").
10. The user confirms.
11. The system adds the user in the group member's list with the role "member".
12. The system updates the group's members count and user's list of joining groups.
13. The system sends confirmation notification to the user.
14. The system notifies the team leader that a new member has joined.
15. The system shows a successful message ("you have successfully joined the group") and changes the button to "joined".

Extensions (Alternative flow):

Alternatives:

***a. system failure:**

a.1 If System failure occurs at any point during use case, the system displays an error message.

a.2 After the system is resorted, the Member logs in again and resumes Join Group process.

1. Team leader restarts system and logs in.

2a. Invalid login credentials:

1. System displays an error message when the entered username and password is wrong.
2. User enters the correct login credentials.
3. System validates the credentials and continues from step 3.

7a. User has not joined any neighborhood

1. The system checks whether the user belongs to a neighborhood.
2. If user has not joined any neighborhood, the system informs the user that they must join a neighborhood before joining a group.
3. User joins a neighborhood.
4. System compares the user's neighborhood with the neighborhood associated with selected group, if not match then user continues from step 7b.

5. If comparison matches, then user continues from step 8.

7b. group does not match with neighborhood

1. If the group user has joined does not belong to the neighborhood, from where a user belongs then system shows an error message.
2. System shows groups that are related to the neighborhood user has joined.
3. User selects a group.

Special Requirements:

1. Only an authorized user can join a group.
2. The user requires a stable internet connection for joining a group.
3. The join group request should be proceeded with in about 3 seconds in 90% cases.
4. The system shall clearly display the available neighborhood and groups, provide a clearly visible join and display an easy-to-understand confirmation message.
5. System should provide alert immediately after joining group.
6. The system should not allow duplicate membership.
7. Memberships records must be consistent, with no duplicates.
8. System should log each join action with user group and time.
9. The interface is English only and work on common browsers.

Technology and data variations list:

1. The team leader will access the EAMS on a web browser on a laptop, computer or smartphone.
2. The system uses a database to store users, neighborhood, groups, and group membership information.
3. The system uses drop-down menus for selection of neighborhood from related neighborhoods.

Frequency of occurrence: Occasional

Occurs whenever user wants to an environmental group in related neighborhood.

Open issues:

1. It needs to be decided whether team leader joins group immediately or whether approval from the group team leader is required.
2. It needs to be decided whether there will be maximum numbers of members

allowed in one group.

3. It needs to be decided whether a member can leave group after joining.
4. Will user change group if group member changes his neighborhood? We need to decide this.
5. If user leaves and rejoins again, are their earlier points and participation kept for group ranking?

User Story: Join Groups

(priority: High)

As a user I want to join an environmental group in my neighborhood so that I can take part in its activities and receive its notifications.

Acceptance Criteria:

The system should display clearly visible “join Group” button for an available group.

When user selects “join group”, the system should check whether user already a member of the group.

If user is not already a member, then system adds the user to the group.

The system should update the group’s member list after successful joining.

The system should display a clear confirmation message after successfully joining the group.

If user is already a member, the system should display an appropriate message and should not create duplicate members.

User story 2: view group details

Priority: Medium

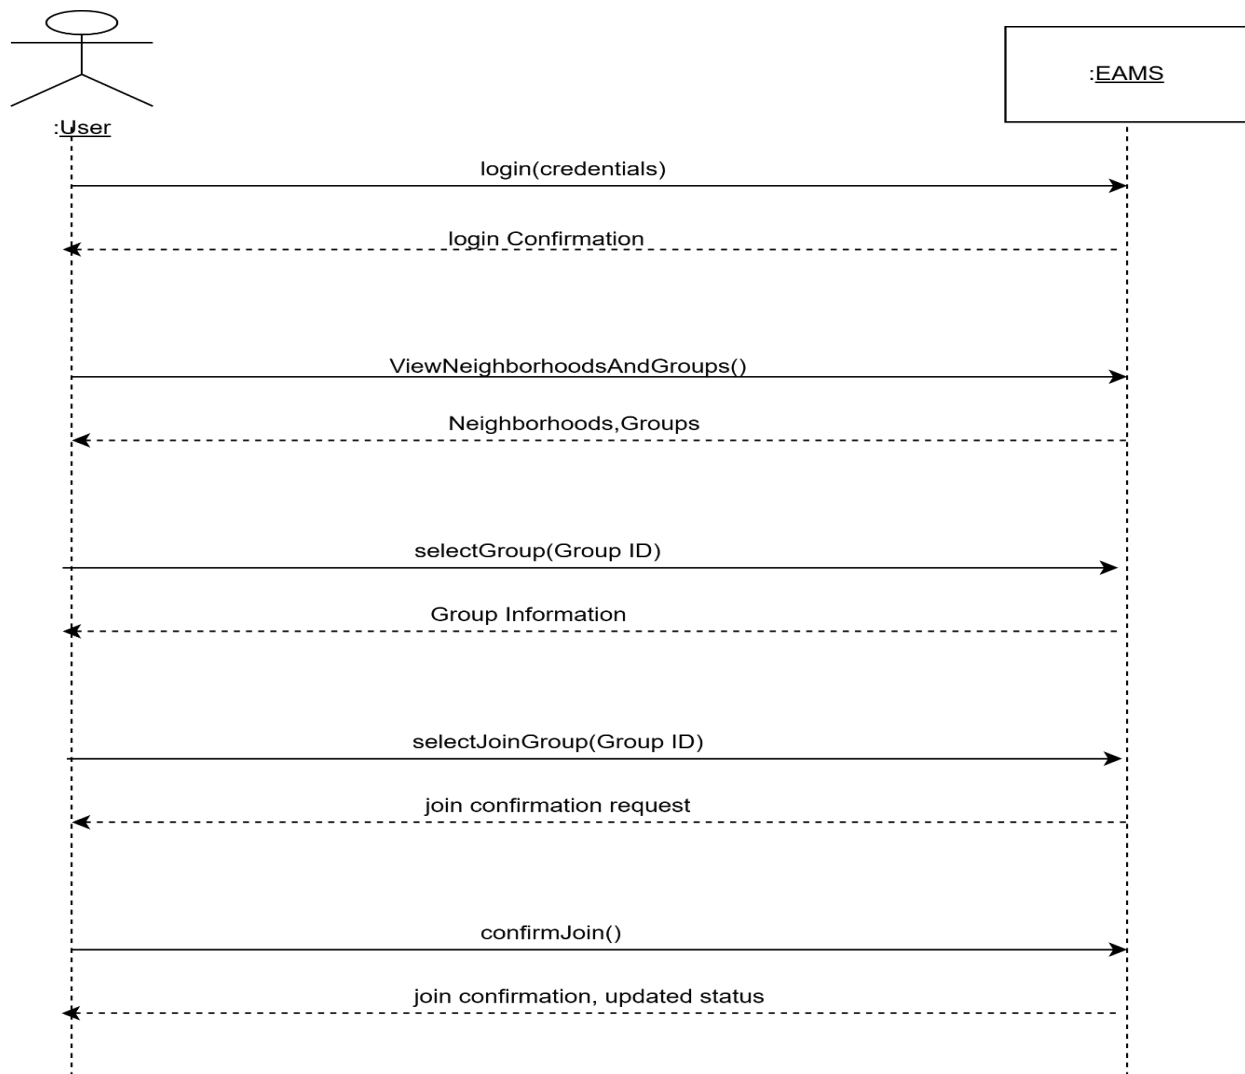

As a user, I want to view the details of an environmental group before joining it so that I can decide whether the group is suitable for me.

Acceptance Criteria:

- The system should display group name and neighborhood.
- The system should display basic group information such as its description, leader and number of members.
- The system should display group’s relevant group activities.
- User should be able to select “join group” option from group details.
- The system should show whether the user has already joined the group.
